

Static Website Hosting

Intro to Static Website Hosting

-  Amazon S3 can be used to **host static websites** that are accessible on the public Internet
-  Website **assets are stored directly in the S3 bucket** to be accessed by users or customers
-  **Client-side scripts** may also be used for the website
-  Buckets support either **hosting a website** or **redirection**, similar to a CNAME DNS record

Accessing Website

Website
Assets

Bucket: `s3.krausen.io`
Region: `us-east-1`

Website Visitor
(home)

Access Your Website

You can use the **default URL** which is tied to the bucket name and the region to access the site

`http://s3.krausen.io.s3-website-us-east-1.amazonaws.com`

Bucket Name

Bucket Region

Access Your Website

-  You can ALSO use your own **custom domain** to access the static website using a CNAME
-  Even better → Add a CloudFront distribution to **add a TLS certificate** to your website

<https://s3.krausen.io>

Redirect

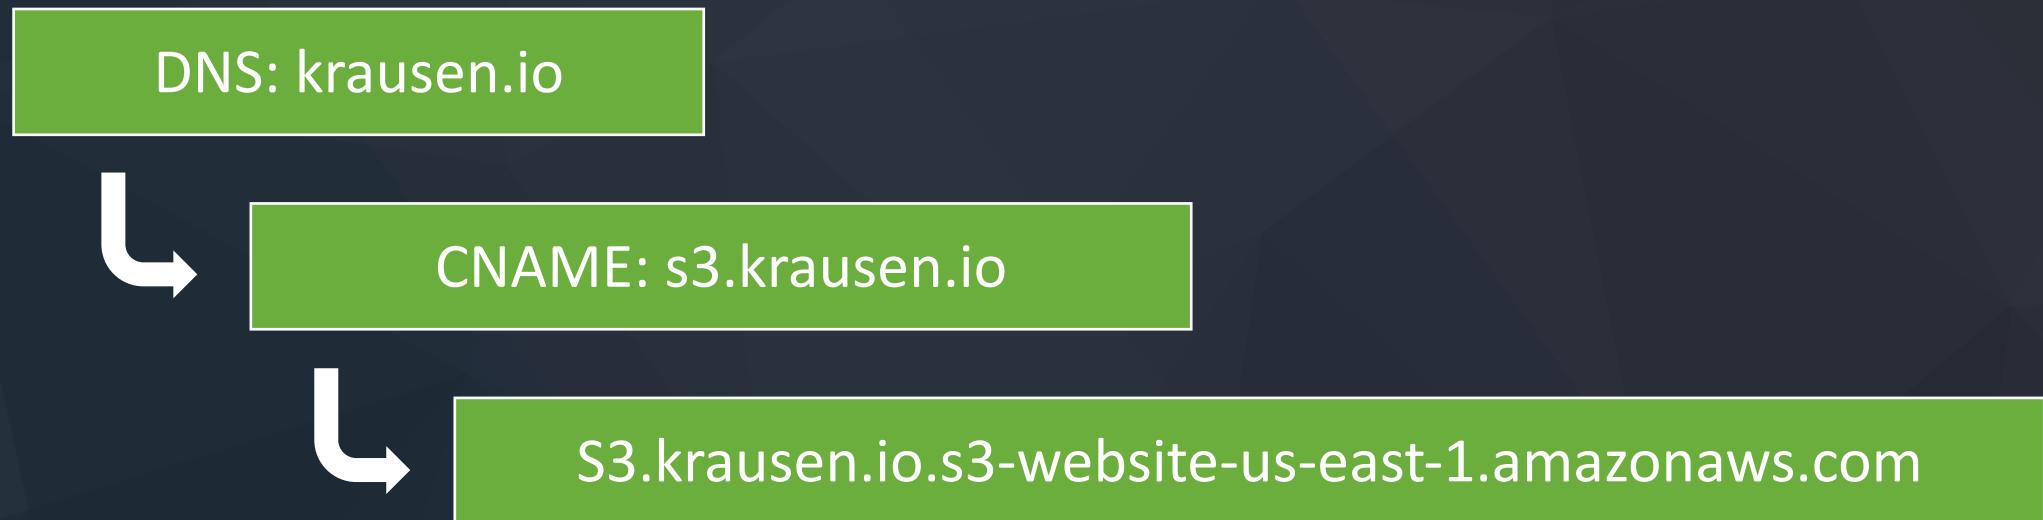

Bucket
Region: **us-east-1**

Using Your Custom Domain

-  Redirection is done using a CNAME record for your own domain to point to the bucket URL

Using a Custom Domain with CloudFront

Bucket: `s3.krausen.io`
Region: `us-east-1`

CloudFront
Distribution

TLS Certificate

`https://s3.krausen.io`

`d111111abcdef8.cloudfront.net`

CNAME

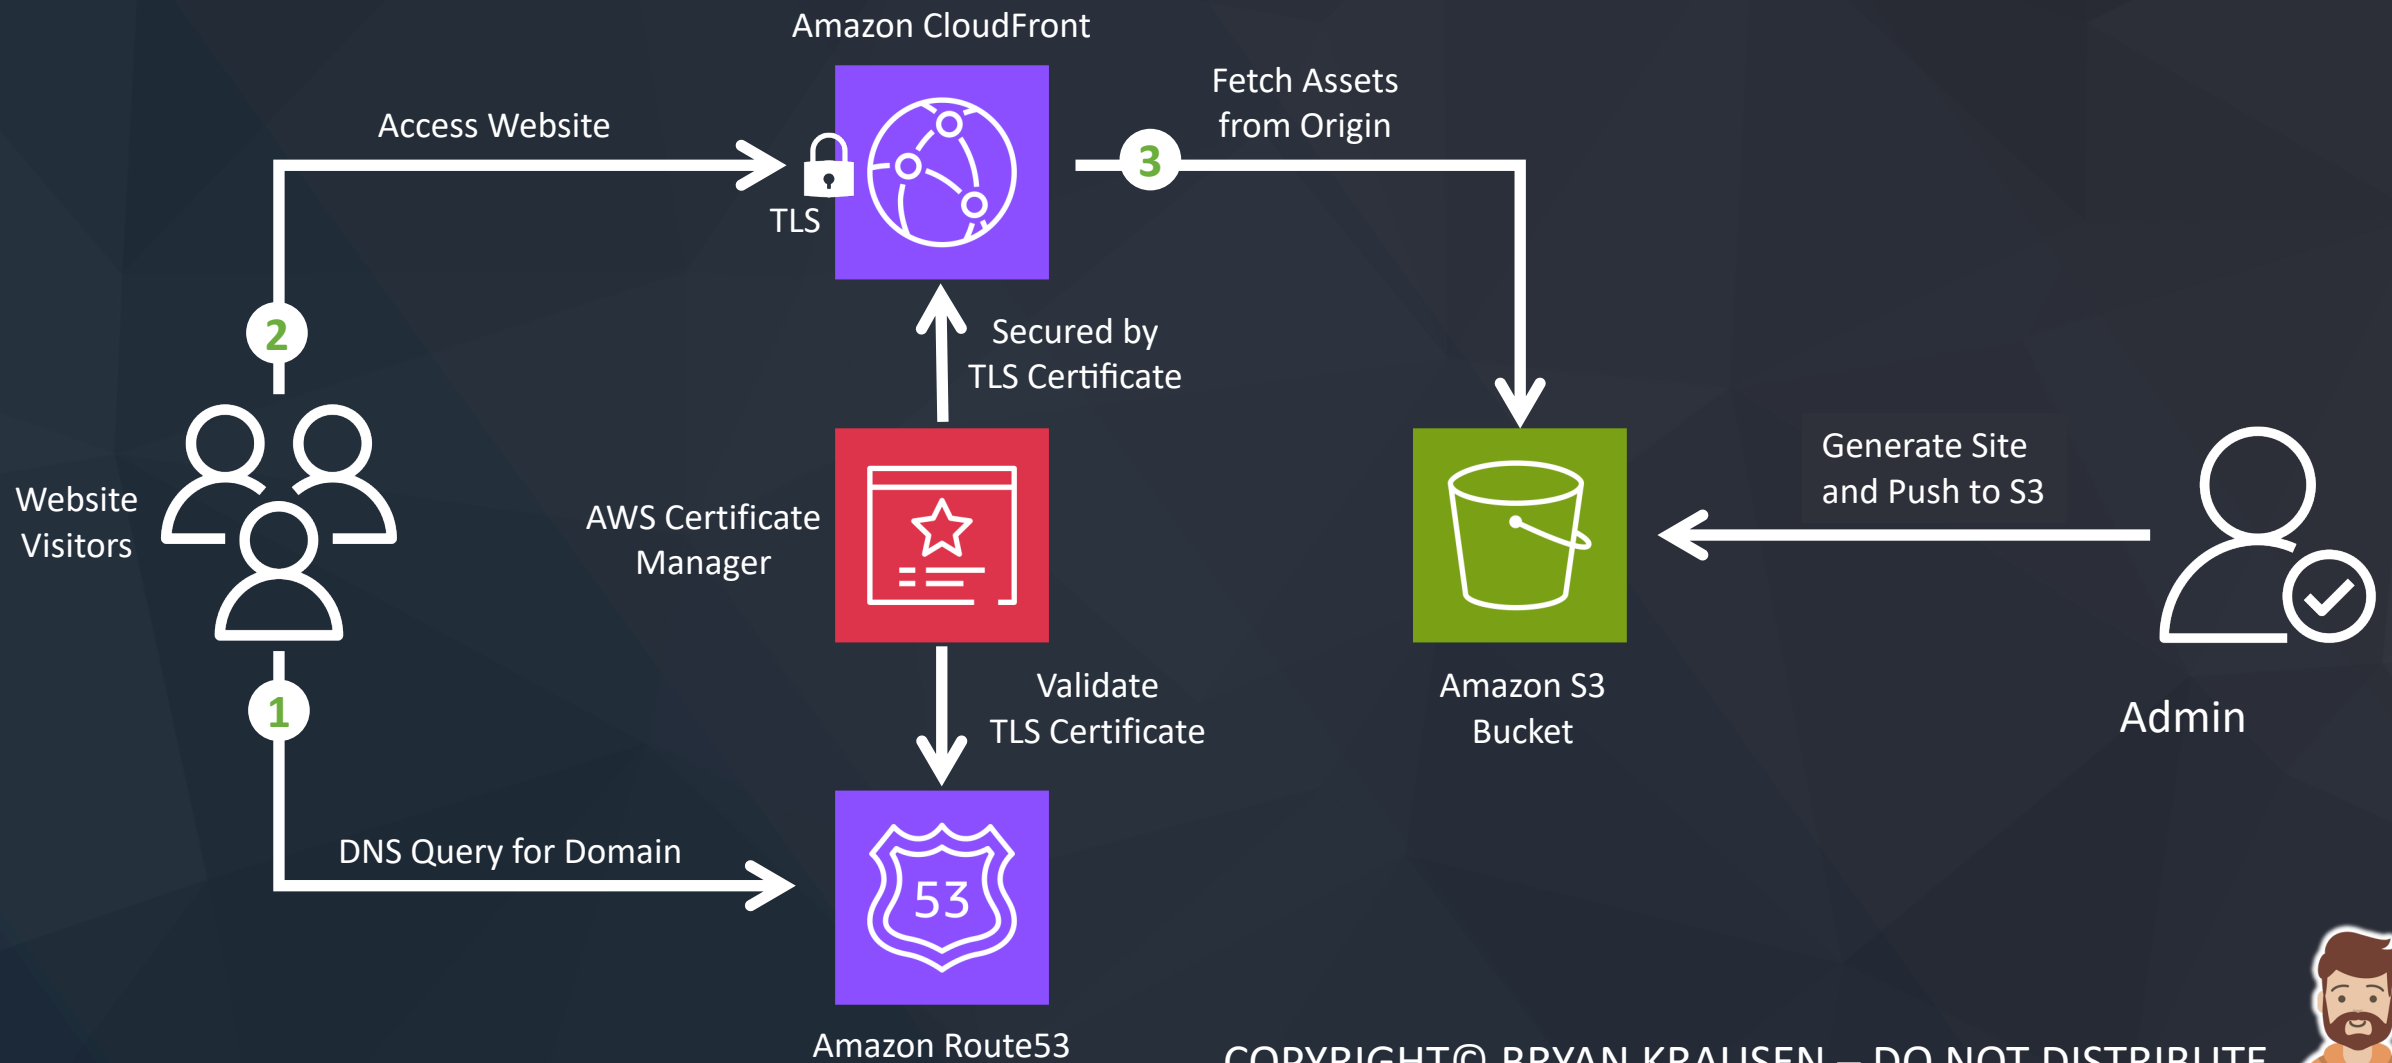

Using Your Custom Domain with TLS

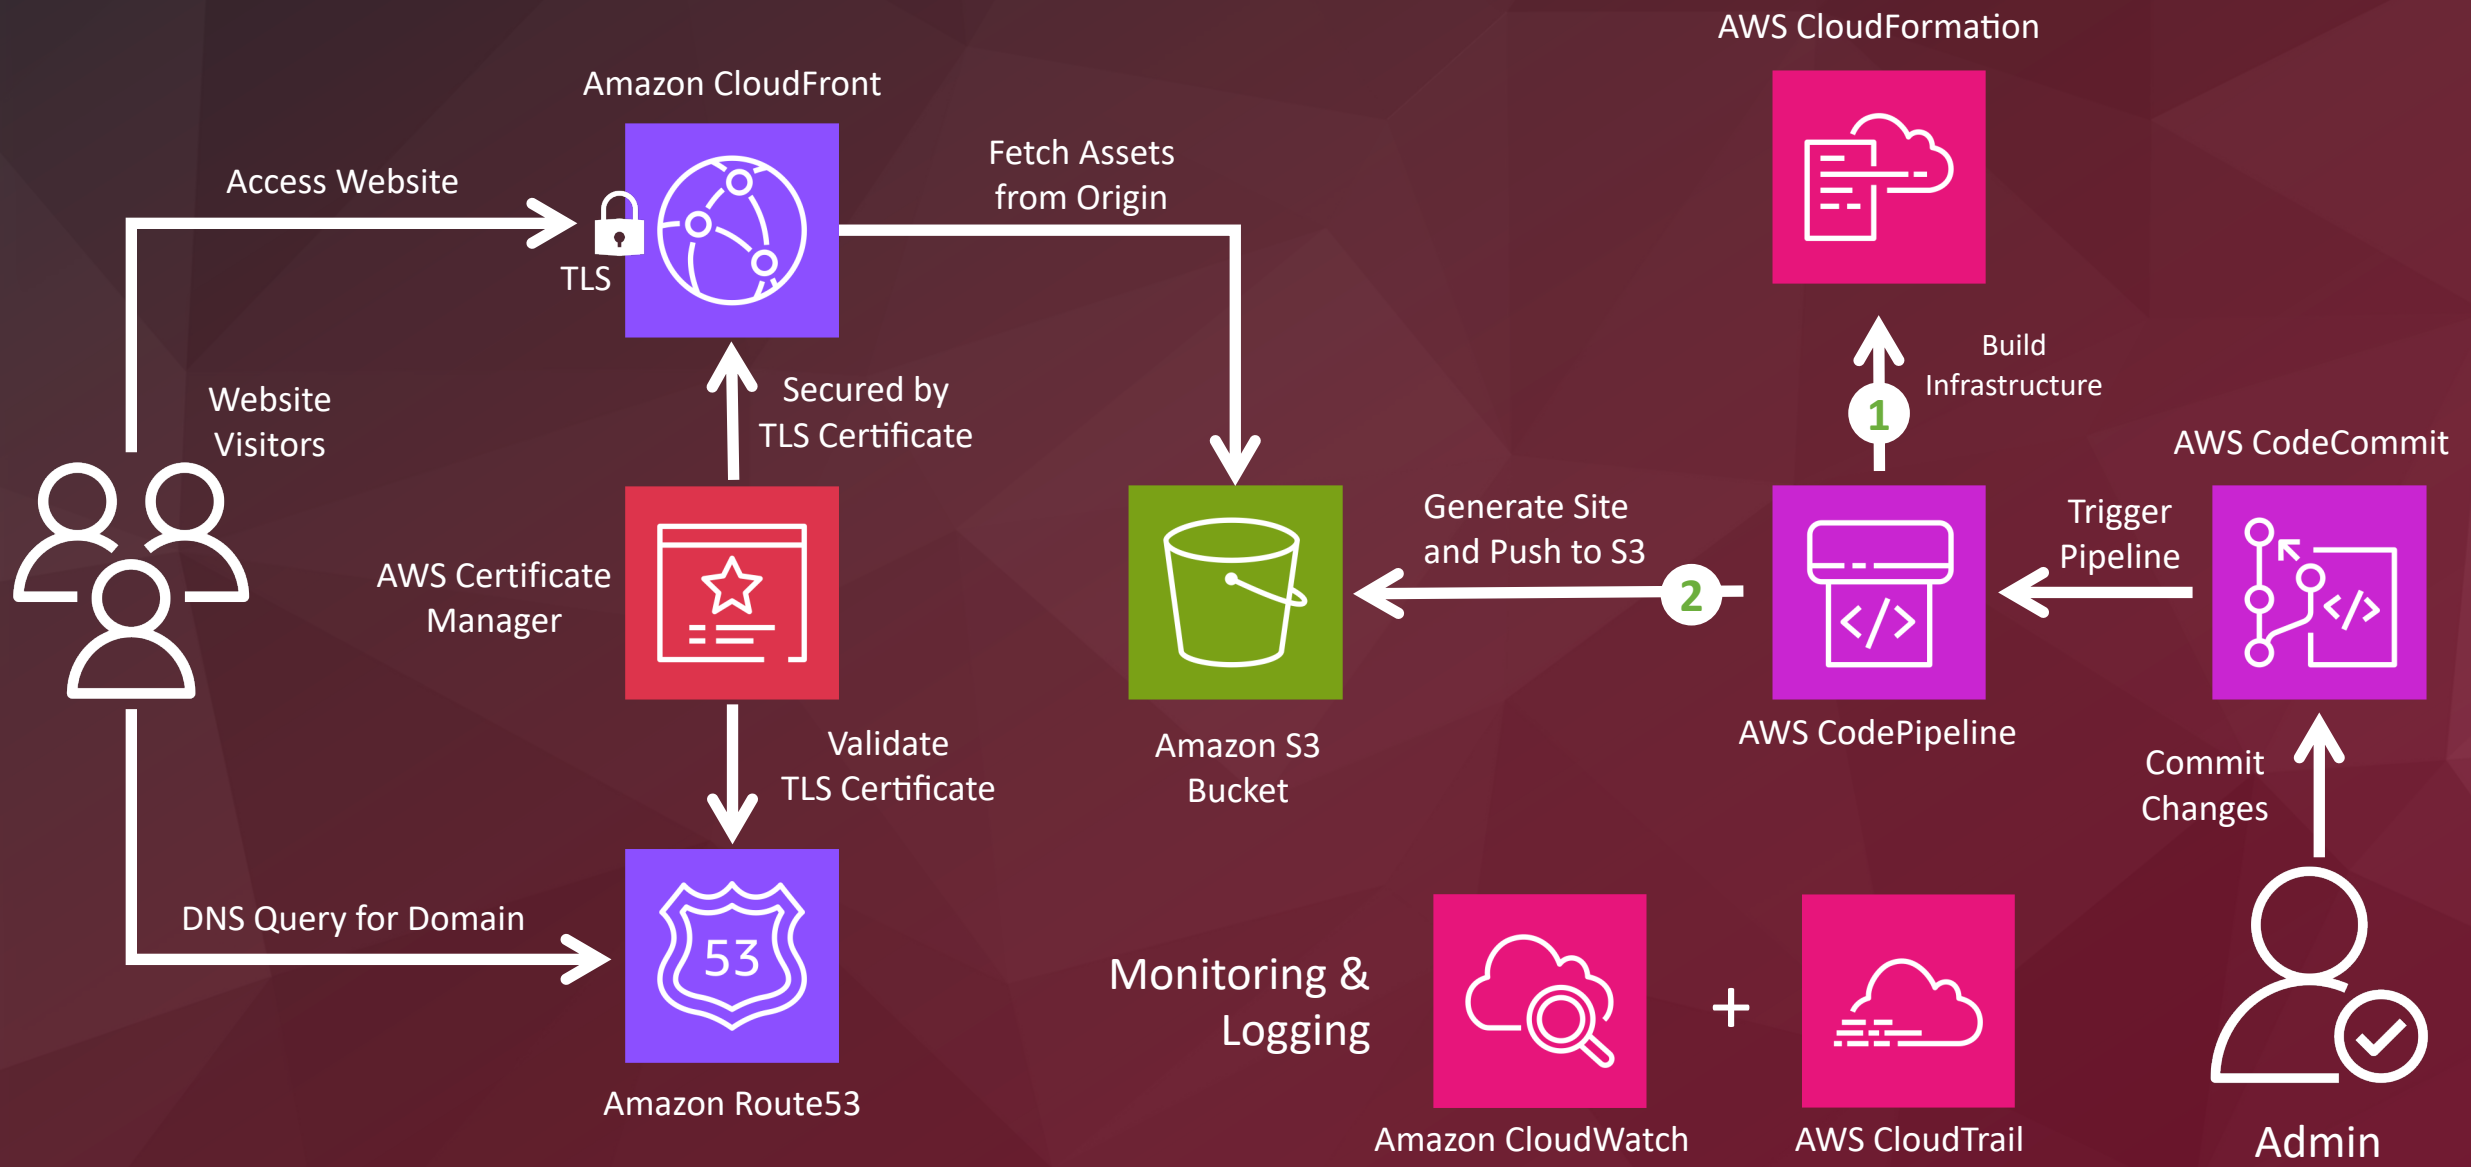

-  Redirection is done using a CNAME record for your own domain to point to the bucket URL

Use AWS Services for the Entire Config

Full AWS DevOps Experience

How Do I Configure It?

1. Static website hosting feature must be enabled 
2. Upload the contents of your site to the bucket 
3. Disable S3 Block Public Access for the bucket 
4. Make objects publicly accessible using a bucket policy 
5. Access the site
